Date: 16 / 03 / 2026

To,
Concerned Authority

Subject: Internship Completion Certificate

This is to certify that Mr. Bukera Inayat has successfully completed 120 hours of internship at Rifat Enterprise from 01/12/2025 to 15/03/2026.

During the internship period, he worked on the development of a Web-Based Inventory Management System for our organization. He demonstrated dedication, technical knowledge, and professionalism while completing tasks related to raw material management, production tracking, sales management, and reporting modules.

His performance during the internship was satisfactory, and we wish him success in his future academic and professional endeavours.

Sincerely,

Authorized Signatory
Rifat Enterprise

Preface

The main objective of this project is to gain practical knowledge and hands-on experience in web development, which is an essential skill for any computer science student. Developing an **Inventory Management System for Rifat Enterprise** allowed us to combine both theoretical concepts and practical implementation, providing a comprehensive learning experience.

During the course of this project, we explored various aspects related to system design, database management, user interface development, and inventory tracking. This process helped us enhance our problem-solving abilities and understand the challenges involved in developing a real-world business application.

Through this project, we learned how to manage raw materials, production data, product stock, and sales information efficiently using a web-based system. The development process also helped us understand how software solutions can improve business operations by replacing manual record-keeping with a structured digital system.

We are pleased to present this project report, which has been carefully organized for easy understanding. Throughout the development process, several software engineering principles and best practices have been applied to ensure that the system is reliable, efficient, and user-friendly. This project has been an important step in strengthening our technical knowledge and preparing us for future opportunities in the field of software development.

Acknowledgment

We, the students of BCA Semester-6 at **kamani Science College**, Amreli, would you like to express our heartfelt Gratitude We sincerely thank **Prof. Paraskumar Thummar** for their invaluable guidance, motivation, and constant support of this project. Their insights and encouragement have played a crucial role in helping us understand The technical and conceptual aspects of the system.

We are also deeply grateful to the head of Department for providing us with the opportunity and inspiration to take this project. A special thanks to all faculty members and administrative staff of our institute for their continued support and resources.

Lastly, we extend our warm thanks to our friends for their help and cooperation , whether directly or indirectly, and to our families for their endless encouragement and support throughout this journey.

Thank to all !

Bukera Inayat

Boricha Jaysukh.

Abstract

The **Rifat Enterprise Inventory Management System** is a web-based platform designed to efficiently manage and monitor the inventory operations of the organization. This system aims to streamline stock tracking, product management, and overall inventory control through a centralized and user-friendly interface.

The project focuses on developing a modern and efficient system where administrators and staff can add, update, and manage product details, monitor stock levels, and maintain accurate records of incoming and outgoing goods. It includes features such as product categorization, real-time stock updates, supplier management, sales tracking, and automated alerts for low inventory levels.

The platform benefits the organization by reducing manual errors, improving operational efficiency, and ensuring better decision-making through accurate data management. With an intuitive layout and secure access controls, the system enhances productivity and helps Rifat Enterprise maintain optimal stock levels while minimizing losses and delays.

Additionally, the system supports report generation and data analysis, enabling management to track inventory trends and improve future planning. Overall, the Inventory Management System serves as a reliable and scalable solution for modern business inventory operations.

Introduction

An Inventory Management System for Rifat Enterprise for Blocks is a software-based solution designed to efficiently track and control the business stock of concrete blocks, raw materials, and related supplies.

The system helps the enterprise maintain accurate records of incoming and outgoing blocks, monitor stock levels in real time, and prevent shortage or overstock situations.

By organizing inventory data such as supplier details, quantities in hand, and transaction records, the system supports better planning, reduces manual errors, and improves overall operational efficiency in fulfilling customer orders and managing daily transactions.

The proposed system aims to replace the traditional manual method with a **digital inventory management system** that improves accuracy, efficiency, and reliability. By using this system, the administrator can easily record and monitor all important business activities such as raw material purchases, block production, finished goods stock, and sales transactions.

Objective Of Project

Welcome to the Inventory Management System developed for **Rifat Enterprise**, a business involved in the manufacturing and trading of bricks, cement blocks, and interlocking tiles. This system is designed to improve the efficiency of managing raw materials, production processes, and sales activities.

The proposed system is a **web-based application** that helps the organization maintain accurate records of raw materials, production details, product stock, and customer sales. It replaces the traditional manual record-keeping system and provides a faster, more reliable way to manage business operations.

The platform allows administrators and staff to easily monitor inventory levels, record production activities, manage sales transactions, and generate reports. This system improves transparency, reduces human errors, and supports better decision-making for the business.

Benefits of the system :

1. Efficient Inventory Management:

The system allows administrators to easily add, update, and track raw materials and finished products, ensuring accurate stock records.

2. Production Tracking:

The platform records daily production activities and automatically updates product stock based on raw material usage.

3. Sales Management:

Staff can manage sales transactions details, and generate reports, helping the business monitor revenue and profit.

Time Line

Time Line Chart

1. Study Of Existing System → 10 Days
2. System Analysis → 15 Days
3. System Design → 20 Days
4. Coding → 40 Days
5. Testing → 10 Days
6. Documentation → 10 Days

Hardware & Software Requirement

Hardware Requirement

- 512+MB of Ram
- Multimedia keypad and mouse
- GHz processor
- Monitor

Software Requirement

- Operating System: Microsoft Window 10
- Front-end Tool: HTML, JS,CSS
- Back-end Tool: PHP, Mysql
- Documentation Tool: MS Visio

Requirement Specification

Rifat Enterprise Inventory Management System – Q&A

Q1. What is the name of your factory?

⇒ Rifat Enterprise.

Q2. Who can use this system?

⇒ Admin only.

Q3. What are the main benefits of the website?

⇒ The system allows the admin to manage raw materials, products, and sales efficiently.

Q4. What is the problem definition statement and why does Rifat Enterprise need an inventory management system?

⇒ Rifat Enterprise currently faces difficulties in manually managing raw materials, production records, stock levels, and sales. Manual record keeping often leads to errors, stock mismatches, and poor decision making. Therefore, an inventory management system is required to automate stock tracking and manage production and sales more efficiently.

Q5. What are the functional and non functional requirements?

⇒ Functional requirements include managing raw materials, production, finished goods, sales, suppliers, customers, and generating analysis reports.

Non functional requirements include system security through user authentication, fast response time, data accuracy, reliability, and an easy to use interface.

Q6. What are the technical, economic, and operational feasibilities of developing the system?

⇒ The system is technically feasible because it is developed using PHP, MySQL, HTML, CSS, and JavaScript, which are widely available and easy to implement technologies.

Q7. Which type of system architecture is followed?

⇒ Three tier architecture consisting of User Interface (UI), Application Logic, and Database layers.

Q8. How is stock updated in the system?

⇒ Stock is automatically updated during production entries and sales entries.

Q9. Which type of blocks are produced?

⇒ Two types of blocks are produced:

1. Bricks
2. Cement Blocks

Q10. How is system security maintained?

⇒ System security is maintained through user authentication, role based access control, and session management.

Q11. What is raw material management in your system?

⇒ Raw material management allows the admin to **add, update, and monitor the stock levels of materials such as cement, sand, aggregate, and red sand used in production.**

Q12. What is production management in the system?

⇒ Production management records the **daily production of bricks and cement blocks and automatically updates raw material consumption and finished product stock.**

Q13. How does the system help in sales management?

⇒ The system records **product sales, customer information, quantity sold, and total amount**, which helps in tracking revenue and stock levels.

Q14. What are the limitations of your system?

⇒ The system currently supports **only admin access and basic reporting. Advanced analytics and multi-user roles can be added in future versions.**

Q15. What testing methods were used during development?

⇒ The system was tested using **unit testing, integration testing, and system testing to ensure accuracy and reliability.**

Q16. What is the role of suppliers in the system?

⇒ Suppliers provide raw materials, and their details are stored in the system to **track material purchases and supplier transaction.**

Project Planning & Scheduling

1. Planning

Planning is the process of deciding in advance what needs to be done, how it will be done, and who will be responsible for completing the tasks. In this project, planning helped us clearly define the system objectives, project scope, required technologies, and development timeline.

During the planning phase, our team discussed the business requirements of **Rifat Enterprise**, which manufactures and sells **bricks, cement blocks, and concrete interlocking tiles**. The current manual record keeping system creates difficulties in tracking raw materials, production, and sales. Therefore, we planned to develop a **web-based Inventory Management System** to solve these problems.

The system was divided into the following main modules:

- Login authentication for secure system access
- Raw material management (Add, Update, Delete, View materials)
- Supplier management
- Production management for bricks, cement blocks, and tiles
- Finished product stock management
- Sales management and order tracking
- Revenue and loss reporting dashboard

Our team also selected the technologies required for system development. The system is developed using **HTML, CSS, and JavaScript for frontend design, PHP for backend logic, and MySQL for database management**.

Since this is a team project, responsibilities such as **frontend development, backend programming, and database design were handled collaboratively**. Proper planning helped us divide work efficiently, maintain coordination among team members, and ensure smooth development of the system.

1. Scheduling

Scheduling is the process of organizing project activities in a logical order along with their time duration. After defining the system modules during the planning phase, a schedule was created to complete each phase of the project within the given internship period.

The project development was carried out in the following sequence:

- Requirement analysis of Rifat Enterprise inventory system
- System design including DFD, Use Case Diagram, Class Diagram, and Sequence Diagram
- Database design for managing raw materials, production records, products, and sales
- Frontend interface design for user dashboard and forms
- Backend development for handling system logic and database interaction
- Integration of frontend, backend, and database modules
- System testing and debugging
- Final implementation and project documentation

Scheduling provided a clear development roadmap and ensured that the team completed tasks in a systematic and timely manner.

Relationship between Planning & Scheduling

- **Planning answers:** What needs to be done in the project?
- **Scheduling answers:** When and in what order will the tasks be completed?

Both planning and scheduling worked together to ensure that the project development remained organized, efficient, and completed successfully within the allocated time.

(SDLC)

Software Development Life Cycle

The Software Development Life Cycle is the cost effective and time – efficient process that development teams use to design and build high – quality software.

System Analysis

Existing System

In the existing system, inventory records at **Rifat Enterprise** are mostly maintained manually using paper registers and notebooks. Information about **raw materials, production, stock levels, and sales** is recorded by hand. This manual process makes it difficult to track the exact quantity of materials such as cement, sand, aggregate, and red sand used during production.

Production details of **bricks, cement blocks, and concrete interlocking tiles** are also written manually, which increases the chances of calculation mistakes and missing records. Managing product stock and recording daily sales becomes time-consuming and sometimes leads to incorrect stock information.

Searching, updating, and maintaining records becomes more difficult as the amount of data increases. There is no centralized system to store and organize the information. Generating reports such as stock status, sales records, and revenue analysis requires a lot of time and manual effort.

Because of these limitations, the current manual system is **slow, error-prone, and inefficient**, making it difficult for the business to manage inventory and production effectively.

Proposed System

The proposed **Inventory Management System for Rifat Enterprise** is a web-based application designed to automate and simplify the management of raw materials, production, and sales.

The system provides a **secure login for the administrator** and stores all information in a centralized database. It allows easy management of raw materials, suppliers, production records, finished product stock, and sales transactions.

The system automatically updates stock levels when materials are purchased, products are produced, or items are sold. It also generates organized records and reports such as **stock reports, production reports, and revenue analysis**.

By replacing the manual record-keeping process with a computerized system developed using **HTML, CSS, JavaScript, PHP, and MySQL**, the enterprise can save time, reduce errors, improve data accuracy, and manage inventory more efficiently.

The proposed system will make business operations more organized, transparent, and reliable for managing production and sales activities.

Problem Definition

Rifat Enterprise currently manages its inventory using manual methods such as paper records and basic spreadsheets. This traditional system creates several operational challenges that affect the efficiency, accuracy, and productivity of the business.

Due to the absence of a computerized inventory system, the organization faces difficulties in tracking stock levels, updating product information, monitoring supplier details, and generating reports. Manual data entry increases the chances of human error, duplication of records, misplaced files, and incorrect stock calculations.

The existing system also makes it hard to:

- Maintain real-time stock updates
- Track sales and purchase records efficiently
- Identify low-stock or out-of-stock items
- Generate accurate billing and invoices
- Prepare monthly or yearly inventory reports
- Maintain proper supplier and customer records

As the business grows, handling inventory manually becomes time-consuming and inefficient. Delays in stock updates may lead to overstocking or stock shortages, resulting in financial loss and poor customer satisfaction.

Therefore, there is a need to develop a computerized **Inventory Management System (IMS)** for Rifat Enterprise. The proposed system will automate inventory tracking, manage product details, maintain stock records, generate bills and reports, and improve overall operational efficiency.

The system aims to:

- Reduce manual errors
- Improve data accuracy
- Provide real-time inventory updates
- Enhance decision-making through reports
- Save time and operational costs

Feasibility Study

1). Technical feasibility:

The proposed system can be developed using standard web technologies such as:

Front-end: Html, Css, JavaScript

Back-end : PHP,

Database : MySQL

Hosting : XAMPP (for local)

The Required Software and tools are easily available and simple to use

2). Operational feasibility:

The System is user-Friendly and easy to operate by staff and admin.

It will reduce manual record keeping and paperwork.

The admin can easily manage raw Materials, Production, and Sales.

The System helps in tracking Stock, Revenue and Profit efficiently.

3). Economic feasibility:

Development costs is low because open source technologies are used.

Hosting and Maintenance Costs are Minimal.

The System Reduce Financial Losses created by Stock Mis-Management

Testing

What is Testing ?

Testing is the process of evaluating and verifying that a software product or application.

Does what it is supposed to do.

Types of Testing

- Manual testing
- Automation testing

Manual Testing

➤ **White Box Testing:-**

- It is Software testing technique that
Involves testing the internal structure and working of a
software application.

➤ **Black Box Testing:-**

- A form of testing that is performed with no knowledge
of a systems
Internals.

➤ **Gray Box Testing:-**

- In Gray box testing, the tester is not required to design
test case.

Test Case

Login Form

Test case ID	Test Step	Input Data	Expected Result	Actual Result	Execution status
01	Enter Email and Password & click on Login button	Enter Valid Email & Password	User Should be go on Dashboard page	User Login Successfully	Successfully
02	Enter Email and Password & click on Login button	Enter invalid Email & Valid Password	Invalid email or password message will be display	User Not Login Successfully	Successfully
03	Enter Email and Password & click on Login button	Enter valid Email & invalid Password	Invalid email or password message will be display	User Not Login Successfully	Successfully
04	Enter Email and Password & click on Login button	Enter invalid Email & Password	Invalid email or password message will be display	User Not Login Successfully	Successfully
05	Enter any page with unauthorized access	Without email & password	Redirect to login page	Redirecting to login page	successfully

Pros and Cons For System

Advantage Of Project (Pros):-

- Reduce Manual Paper work and Error.
- Provide real time Stock Tracking.
- Save Time in Inventory Management.
- Easy Report Generation.
- Secure Role Based and login access Controls.

Limitations of Projects (Cons):-

- Requires Internet or System availability.
- Staff need basic training to use system.
- Risk of data loss without proper backup
- Dependence on computer system

Bibliography

Bibliography means take reference to prepare any project.

Here we are concern the book and websites which takes reference is as under.

Rules & Guidelines for Students

1. The student must complete 120 hours of internship during Semester VI.
2. Daily entries must be made in the logbook and duly signed by the supervisor.
3. Any absence must be mentioned clearly with valid reasons.
4. The logbook should be neat, updated, and authentic.
5. Submission of the logbook is compulsory for evaluation and award of credits.

Daily Internship Log

Date:

Day:

Index	Nature of Work/Activities Performed	Subject/Name of Task	No. of Hours
1	Requirement discussion with owner	Requirement Gathering	4
2	Study of manual record system	System Analysis	4
3	Identifying system modules	Module Planning	4
4	Designing system flowchart	System Design	4
5	Creating database schema	Database Design	4
6	Defining vehicle data fields	Data Structure Setup	4
7	Preparing project documentation	Project Planning	4
8	Finalizing development tools	Technology Selection	4

 Signature of Mentor/Principal

Student's Reflective Report

(The student should reflect on learning experiences, challenges faced, skills developed, and the relevance of the internship to their academic programme.)

LEARNING EXPERIENCES AND TECHNICAL DEVELOPMENT

During my three-and-a-half-month internship (105 days), I had the opportunity to work on the development of an Inventory Management System for Rifat Enterprise, a manufacturing and trading business dealing with bricks, cement blocks, and concrete interlocking tiles. This project enabled me to transform the theoretical knowledge gained during my academic studies into practical implementation within a real industrial environment. The experience significantly improved my understanding of how software systems are developed to solve real-world business challenges.

Throughout the development process, I gained practical exposure to the Software Development Life Cycle (SDLC), including requirement analysis, system design, implementation, testing, and deployment. Initially, I conducted discussions with the business owner to understand their existing manual inventory system and identify operational problems such as raw material mismanagement, inaccurate stock tracking, delayed production updates, and lack of proper financial reporting. This phase helped me understand the importance of requirement gathering, documentation, and stakeholder communication.

From a technical perspective, I designed a structured database to manage raw materials (cement, sand, aggregate, red sand), finished products (bricks, cement blocks, tiles), production records, sales data, customer information, and stock levels. I implemented core functionalities such as adding, updating, deleting, and searching records (CRUD operations). I also developed automated stock update logic where raw materials are reduced during production and finished goods stock is updated during sales. Additionally, I implemented authentication and role-based access control to ensure secure login and proper user management.

On the frontend side, I focused on designing a clean and user-friendly interface that allows staff and administrators to manage inventory, production, and sales efficiently. The dashboard was developed to display important business metrics such as total sales, pending payments, stock levels, and profit/loss information. Working on the user interface enhanced my understanding of usability, simplicity, and clarity in system design.

CHALLENGES FACED AND PROBLEM-SOLVING SKILLS

During the internship, I encountered several technical and practical challenges while developing the Inventory Management System for Rifat Enterprise. One of the major challenges was understanding the real operational workflow of a manufacturing business.

Unlike academic projects, this system needed to handle actual production processes, raw material consumption, finished goods stock updates, and real sales transactions. I had to carefully analyze how raw materials such as cement, sand, and aggregate are used in production before designing the system logic.

Another significant challenge was designing the database structure and maintaining data consistency. Creating relational tables while maintaining proper relationships between raw materials, production records, products, customers, and sales transactions required careful planning. I learned the importance of normalization, foreign key relationships, and preventing duplicate or inconsistent data entries.

Implementing automatic stock update logic was also challenging. During production, raw materials needed to be reduced, and finished product stock had to be increased. Similarly, during sales, product stock had to decrease automatically. Ensuring accurate calculations and preventing negative stock required thorough testing and validation.

Debugging errors during backend and frontend integration was another important learning experience. Sometimes data did not display correctly due to incorrect SQL queries, validation issues, or logic errors. By testing different scenarios and carefully reviewing the code, I improved my analytical thinking and problem-solving skills.

Time management was also a key challenge. Completing the project within 105 days required proper planning, task scheduling, and continuous progress monitoring. This experience strengthened my ability to meet deadlines while maintaining system quality and performance.

SKILLS DEVELOPED AND PROFESSIONAL GROWTH

During this internship, I significantly improved both my technical and professional skills. Technically, I strengthened my understanding of database design, CRUD operations, data validation, system integration, and UI/UX principles. Working on testing and debugging enhanced my problem-solving and analytical abilities.

On the professional side, I developed better communication skills through regular discussions and feedback. I learned the importance of clearly understanding client requirements before implementation. This project also improved my decision-making confidence and helped me develop the habit of writing clean, structured, and well-documented code.

RELEVANCE TO ACADEMIC PROGRAMME

This internship project aligns closely with my academic curriculum under Saurashtra University. The concepts applied during the development process directly relate to subjects such as Software Engineering, Database Management Systems, and Web Application Development.

The practical exposure provided deeper insight into SDLC methodologies and real-world project execution. Many theoretical concepts, such as normalization, system architecture, validation techniques, and performance optimization, became clearer when implemented practically.

Working on this project has strengthened my foundation for advanced studies and future career opportunities in software development and system design. It has also helped me understand the gap between academic projects and professional industry standards.

CONCLUSION

In conclusion, my internship experience working on the Inventory Management System for Rifat Enterprise has been highly enriching and professionally rewarding. The 105-day duration provided sufficient time to understand the manufacturing workflow, analyze business requirements, design an efficient system, and implement a functional solution that improves inventory control, production tracking, and sales management.

This project significantly enhanced my technical knowledge in PHP, MySQL, database design, and system development. It strengthened my problem-solving abilities, logical thinking, and understanding of real-world business operations. Additionally, it helped me develop professional work ethics such as time management, responsibility, and effective communication.

I am confident that the practical knowledge and hands-on experience gained during this internship will greatly support my future academic growth and contribute positively to my professional career in the IT industry.

Supervisor's Evaluation

- **Punctuality&Regularity:**Excellent/Good/Satisfactory/Poor
- **QualityofWork:**Excellent/Good/Satisfactory/Poor
- **CommunicationSkills:**Excellent/Good/Satisfactory/Poor
- **OverallPerformance:**Excellent/Good/Satisfactory/Poor

Comments:

The student has demonstrated strong commitment, dedication, and professionalism throughout the three-and-a-half-month internship while working on the Inventory Management System for Rifat Enterprise. His punctuality and regular attendance were commendable, and he consistently completed assigned tasks within the specified timeline.

The quality of work delivered during the development of the system was highly satisfactory. He showed a clear understanding of the operational workflow of a brick, cement block, and interlocking tile manufacturing business and successfully translated business requirements into a functional and efficient web-based inventory management system. The implementation of core modules such as raw material management, production tracking, sales management, stock control, and profit/loss reporting reflected strong technical skills and logical thinking.

He approached challenges with patience and analytical problem-solving abilities. The database design was well-structured with proper relationships between raw materials, production, products, and sales records. The system interface was user-friendly and practical for real-world business operations. His coding practices were organized, maintainable, and aligned with standard software development principles.

Overall, the student performed at an excellent level during the internship period. His technical knowledge, willingness to learn, and professional attitude make him well-prepared for future academic growth and career opportunities in the field of software development. I confidently recommend him for academic and professional advancement.
